

Marble Park ERP: Live Production Handover

Production handover for the universal retail product, tile, CRM, stock, procurement, dispatch, and reporting lifecycle.

Executive Summary

- **The isolated production system is live and ready for controlled client onboarding.** The application is served over HTTPS from the new Marble Park AWS account, all four production services are running, authenticated owner access works, and the application reports a readiness score of 96.
- **The requested retail lifecycle is implemented as one connected system.** Governed brand/category/finish masters, immutable SKUs, tile design and packaging controls, opening stock, lot-based inward, QR labels, partial quote-to-order, shortage procurement, partial dispatch, returns, stock counts, closing reports, and CRM follow-up are present in the deployed stack.
- **The tile answer is a searchable design-to-SKU model, not a 3,000-item dropdown.** Each displayed or sellable design is registered once with its internal/manufacturer code and images; exact physical variants become immutable SKUs; each inward creates traceable lots and labels. Bulk import and code-first search make catalogue scale operationally realistic.
- **Go-live risk is now procedural rather than architectural.** Before staff usage, attach the client-owned domain, approve off-host backup retention, create named role-based users, load reviewed masters/opening stock, and complete client UAT and training.

Readiness

96

Authenticated application readiness summary.

Source: AWS production deployment audit

Tables: public.User, productionReadinessSummary, Docker Compose service state, Lightsail host capacity

Services healthy

4

PostgreSQL, API, web and Caddy.

Source: AWS production deployment audit

Tables: public.User, productionReadinessSummary, Docker Compose service state, Lightsail host capacity

Active users

1

Clean production account inventory.

Source: AWS production deployment audit

Tables: public.User, productionReadinessSummary, Docker Compose service state, Lightsail host capacity

Tables restored

71

Public tables verified through restore.

Instance / month

\$24

Selected Lightsail bundle before tax and optional services.

Source: AWS production deployment audit

Tables: public.User, productionReadinessSummary, Docker Compose service state, Lightsail host capacity

The new production environment is online and isolated

Marble Park now runs on its own AWS Lightsail host, not the other client environment. The temporary HTTPS address is <https://65-1-24-110.sslip.io>. The Mumbai instance has 2 vCPU, 4 GB RAM, an 80 GB SSD, and a static IP. At handover, disk usage was 17%, 2.8 GB of memory was available, and 4 GB of swap was configured.

The server uses Ubuntu 24.04, Docker Engine, Docker Compose, PostgreSQL 16, the NestJS GraphQL API, Next.js web application, and Caddy TLS edge. Database and application networks remain internal; only HTTP, HTTPS, and SSH are exposed through the Lightsail firewall.

Production verification matrix

Source: Bounded evidence for handover tables

Tables: release_verification, implemented_scope, stock_lifecycle, handover_actions

Area	Verified evidence	Status
Public edge	HTTPS HTTP/2 200; HSTS, frame denial and permissions policy present	Passed
Application services	PostgreSQL, API, web and Caddy running; configured health checks green	Passed
Authentication and access	Owner login, current-user query and user register verified	Passed
Core routes	Dashboard, leads, quote builder, product master, inventory, procurement, dispatch and users loaded authenticated	Passed
Responsive UI	Desktop 1280px, tablet 820px and mobile 390px; no body overflow or console errors	Passed
Backup and restore	Database and assets checksums passed; restore exposed 71 public tables	Passed

Every defined production handover control passed

Twenty-four of twenty-four release controls passed across six areas. The visual counts independent checks rather than scoring business value: route coverage is highest because eight authenticated workspaces were opened, while each infrastructure and recovery area uses its own smaller checklist. A pass confirms the tested release condition; client policy and data-onboarding gates remain in the action plan below.

Passed production controls by area

Table: release_control_counts

The deployed scope covers the full showroom operating story

The release connects commercial intent to physical and financial stock events. A salesperson can start from a lead or create a direct quote, select known SKUs or capture provisional tile details, revise open quantities, and convert only selected quantities to Sales Orders. Available stock is reserved; shortages become purchase demand; receipts create lots and labels; later allocations release partial dispatch without duplicating the quote or order.

Implemented operating scope

Source: Implemented operating scope review

Table: implemented_scope

Domain	Implemented behavior	Operational result
Governed Product Master	Category, brand, finish, vendor, tax, units, packaging, immutable SKU and image gallery	Consistent product identity across quoting, stock, buying and reporting
Tile design catalogue	Design code/alias search, images, size/finish variant SKU, box and coverage conversion, provisional quote selection	Thousands of designs remain searchable without a giant dropdown or fake stock
CRM and quotes	Lead or direct quote, intents, follow-ups, revisions, line image/code snapshots, negotiated rates and room grouping	Sales staff can work on phone or tablet without rebuilding customer selections
Partial Sales Orders	Selected line quantities convert independently with remaining quantity retained	One quote supports multiple orders without duplicate commercial documents
Procurement and inward	Shortage demand, PO commitment, partial GRN, lot creation, allocation, labels and QR scan	Zero-stock SKUs can be sold, ordered, received and traced
Inventory control	Opening stock, transfers, ledger, count sessions, variance approval, reconciliation and year-end closing reports	Physical counts become controlled stock truth without editing history
Dispatch and returns	Pick/pack, partial challan, shipment/delivery proof, backorder continuation and returns	Each order line closes through actual delivered and returned quantities

Tile catalogue scale is solved with four controlled layers

Do not ask staff to browse or manually recreate 3,000 designs one by one. Import supplier catalogues in batches, retain existing showroom/internal codes as aliases, and search by exact code, barcode, brand, collection, size, finish, colour, application, image, and availability. Register only active displayed or quoteable designs; archive discontinued designs without deleting history.

1. **Tile design:** the customer-facing design family, images, brand, collection, manufacturer code and showroom aliases.
2. **Saleable SKU:** the immutable physical variant by design, size, finish, thickness, edge, tax, price and units.
3. **Packaging conversion:** pieces per box and exact coverage so boxes, pieces, square feet and square metres reconcile.
4. **Inventory lot:** each opening-stock or inward receipt with supplier lot, location, cost, received quantity and QR label.

A salesperson may still add a temporary quote-specific image and internal code to a line. That snapshot improves the customer proposal but does not silently mutate Product Master. A provisional design can stay on a draft selection; Sales Order, PO, GRN and dispatch require mapping to a real SKU.

Quantity truth is preserved through every partial event

One immutable line identity follows the transaction end to end. The quote remains the commercial source, Sales Orders consume only selected open quantity, procurement buys only the uncommitted shortage, GRN receives only the remaining PO quantity, allocation links new stock to waiting order lines, and dispatch consumes only ready quantity. Returns and adjustments post compensating ledger events rather than editing history.

Canonical stock lifecycle

Source: Canonical stock lifecycle review

Table: stock_lifecycle

#	Stage	Quantity control	Result
1	Master and opening	Create immutable SKU; post verified opening stock as lots	On-hand and ledger opening entries
2	Quote and order	Consume only selected open quote quantity; reserve available stock	Sales Order line, reservation and shortage
3	Purchase	Buy required minus already committed/cancelled quantity	Purchase demand allocation and PO
4	GRN and labels	Receive no more than PO remaining; separate accepted, damaged and short quantities	Inventory lot, stock ledger, QR labels and waiting-order allocation
5	Dispatch	Pick only allocated/available lot quantity; allow partial challans	Delivered quantity, remaining backorder and stock issue ledger
6	Return and adjustment	Post reasoned compensating events with approval	Return disposition, count variance and auditable stock truth
7	Close and report	Derive status from ordered, allocated, dispatched, delivered, returned and cancelled quantities	Outstanding orders, valuation, movement and year-end closing

Security, access and recovery controls are active

Production starts clean with least practical access. The database contains exactly one active account: Devarsh, role owner. No demo customers, products, quotes, orders or dispatch records were added during deployment verification. New staff should receive named accounts from User Management with the minimum role and only explicit overrides when necessary.

TLS is automatic, server packages receive unattended security upgrades, application data is held in persistent volumes, and a daily local backup timer is enabled. A manual backup was checksum-verified and restored successfully to 71 public tables. The next resilience step is an encrypted off-host copy to S3 with an approved retention and restore-test schedule.

Controlled go-live actions

Source: Controlled go-live action plan

Table: handover_actions

#	Action	Owner	Completion gate
1	Attach client-owned domain and verify DNS/TLS	Implementation + client	Branded HTTPS URL resolves and login succeeds
2	Approve encrypted S3 backup and retention policy	Client owner	Off-host backup plus restore drill passes
3	Create named role-based staff accounts	Devarsh / owner	No shared accounts; permissions reviewed
4	Import approved masters, tile catalogue and opening stock	Master-data and inventory leads	Import exceptions cleared and opening count approved
5	Run scripted client UAT and printer/scanner checks	Business leads	Quote-to-return scenarios signed off
6	Rotate bootstrap password and begin staff rollout	Devarsh / owner	Credential rotation and training complete

Further Questions

1. Which client-owned domain should replace the temporary address?
2. What S3 backup retention is required: 30, 90, or 365 days?
3. Which named staff need owner, sales manager, sales, inventory, dispatch, or office roles?
4. Which approved master and opening-stock files are authoritative for first import?
5. Who signs off tile units, whole-box rounding, price approvals, stock adjustment approvals, and order-close policy?

Caveats and Assumptions

- The temporary `sslip.io` hostname is suitable for verification, not long-term brand identity. A client-owned domain should be attached before formal staff rollout.
- The \$24 monthly amount is the selected Lightsail instance bundle; taxes, data transfer above plan allowances, S3 storage, snapshots, email, and domain charges are separate.
- Responsive production checks used Chromium at 1280, 820 and 390 pixel widths. Final client UAT should include the exact phones, tablets, printers and scanners used in the showroom.

- Backup verification proves the current local backup and restore path. Disaster recovery is not complete until an off-host encrypted copy and scheduled restore drill are approved.
- The PDF intentionally excludes passwords, database secrets, private keys and session tokens. Credentials must be transferred separately and rotated after first sign-in.
