

Marble Park ERP: Full-Stack Acceptance Result

End-to-end verification of Product Master, tile CRM, quote, order, procurement, inward, dispatch, return, reporting and clean restoration.

Executive Summary

- **The connected retail lifecycle passed in the deployed AWS system.** Eleven live scenarios covered role permissions, Product Master and bulk import, tile design identity, CRM revisions, quote PDFs, partial Sales Orders, shortage procurement, GRN lots, exact-lot picks, delivery proof, returns, finance retry safety and management reporting.
- **Live execution found two real product defects, and both are fixed and deployed.** Tile Product Master identity now survives lead/intent handoff into quote and stock workflows. Operations pagination is now typed correctly, making the reconciliation UI load with 24 of 24 products clean and no browser errors.
- **Temporary acceptance data was removed completely.** A checksum-verified pre-test snapshot was restored after UI review. Production returned to one active owner and zero business or E2E records while the code fixes remained deployed.
- **The software is ready for controlled client data onboarding, not unconditional final business sign-off.** Authoritative masters/opening stock, printer and QR-scanner tests, named staff access, a client domain, off-host backups and client UAT remain required before day-to-day use.

The complete operating chain was exercised, not sampled in isolation

The acceptance sequence followed actual dependencies. Product and tile masters fed CRM and quote lines; partial orders created reservations and shortages; procurement and GRN created exact lots; allocation released only ready quantities; dispatch required completed picks and recipient proof; returns restored the original lot; reports and reconciliation read the resulting ledger truth. The table records the principal proof from each scenario.

Live acceptance scenario matrix

Source: Live E2E scenario register

Table: scenario_evidence

Scenario	Verified proof
RBAC and user management	Owner delegation and per-user overrides
Product Master import	2 rows applied; tile packaging kept; invalid row blocked
Quote to partial Sales Orders	2 isolated orders; reservations, demands and retry safety
Procurement and lot allocation	PO, 3 GRNs, 5 lots and damaged separation
Pick, delivery and return	Exact-lot pick, OTP proof and original-lot return
Finance retry and reports	One posting per retry key; stock and finance reported
Tile area pricing	8 boxes/124 sq ft; 3 boxes billed as 46.5 sq ft
Production hardening	GRN, count, payment, delivery, return and readiness 96
Multi-round CRM	Quote v1 to v2, follow-up and new-project branch
Lead intent to partial dispatch	Real tile SKU retained; only ready line dispatched
Quote modes and notifications	3 quotes, 2 PDF modes, stock-ready notices and dispatch

All defined acceptance domains passed

Coverage is shown as passed scenarios per operating domain. Inventory and fulfillment have more scenarios because their failure impact is highest and they contain the most state transitions. The counts are scenario-level evidence, not a claim that every possible future edge case has been exhausted.

Passed live scenarios by domain

Source: Live E2E scenario register
Table: scenario_evidence

Live testing corrected the remaining cross-layer breaks

The useful result was not merely green tests. The run exposed a CRM-to-quote identity contradiction and a GraphQL schema mismatch visible only through the real reconciliation page. Both fixes were compiled, deployed, and retested in the browser. The new restore command closes the operational recovery gap used to clean the test data.

Defects found and closed

Source: Defect and correction register
Table: defect_evidence

Finding	Correction
Tile identity deleted during CRM normalization	Preserve active Product Master identity and stock tracking
Operations `take` exposed as GraphQL Float	Declare every pagination argument as GraphQL Int
No repeatable restore command	Add checksum-gated database and asset restore

Quantity and identity remain controlled through every partial event

Tiles are physical Product Master SKUs, not ad hoc quote text. The quote can retain a salesperson-supplied image snapshot and internal code, while the underlying product identity remains immutable. A zero-stock SKU can be ordered, generate purchase demand, receive against PO/GRN, acquire an exact lot and QR-label source, allocate to its waiting order, and dispatch separately from other lines.

Verified end-to-end lifecycle

Source: Verified business lifecycle register

Table: lifecycle_evidence

#	Stage	Control proven
1	Product and tile master	Immutable SKU, attributes, units, package and image
2	Lead and intent	Ownership, drafts, revisions and Product Master rows
3	Quote and order	Image/code snapshot, GST/rates and partial conversion
4	Shortage and PO	Zero-stock demand and controlled PO quantity
5	GRN, lots and labels	Damage split, exact lot, allocation and QR source
6	Partial fulfillment	Reserved-lot pick, completed pick and delivery proof
7	Return and reporting	Delivered-line return, finance retry and reconciliation

The acceptance run left production clean

The test was intentionally temporary. Database and asset checksums were validated before restore, write-capable services were stopped, the snapshot was restored, and all four services returned healthy. Source hashes for the three deployed backend fix files match the local repository exactly.

Post-test production baseline

Source: Post-acceptance restore audit

Table: cleanup_evidence

Entity	Remaining	Expected	Status
Users	1	1	Passed
Active owners	1	1	Passed
Products	0	0	Passed
Customers	0	0	Passed
Leads	0	0	Passed
Quotes	0	0	Passed
Sales Orders	0	0	Passed
GRNs	0	0	Passed
Challans	0	0	Passed
Returns	0	0	Passed
E2E products	0	0	Passed
E2E users	0	0	Passed

Recommended Next Steps

1. Import approved brands, categories, finishes, vendors, products, tile designs and opening-stock lots in a controlled rehearsal.
2. Run client UAT with real showroom cases: revised intent, edited quote image/code, multiple partial orders, mixed ready/pending items, PO/GRN, partial dispatch and return.
3. Test the exact label printer, QR scanner, phones and tablets used by staff.
4. Create named role-based accounts, review permission overrides, and rotate the bootstrap owner password.
5. Attach the client-owned domain and enable encrypted off-host S3 backup retention with a scheduled restore drill.

Further Questions

1. Which master-data files and opening-stock count are authoritative for the first production import?
2. Which tile codes are manufacturer codes versus Marble Park internal aliases?
3. Who approves price overrides, stock-count variances, damaged receipts and order remainder closure?

4. Which printer label size and QR-scanner model must be certified?
5. What domain and backup-retention policy should be used for client launch?

Caveats and Assumptions

- Software E2E coverage passed for the defined scenarios; this is not a guarantee against every future data combination or operational misuse.
- The production database is intentionally empty after restore. Performance and import behavior with the client's complete catalogue and opening stock still require a rehearsal.
- Browser checks used Chromium at 1440 x 1000. Physical printer/scanner and exact client-device certification remain open.
- Email/WhatsApp delivery integrations were not part of this acceptance scope; quote and order PDFs themselves were generated and validated.
- The temporary `sslip.io` URL is suitable for controlled testing, not the final branded launch.
