

CLIENT WORKFLOW COMPLETION AND RELEASE REVIEW

Commercial workflow is locally release-gated.

The requested Product Master editing, editable quote rates, direct quotes, and repeated partial sales orders now operate as one controlled system. The release gate ran against a clean migrated PostgreSQL database and the compiled API and web application. Railway deployment is deliberately not part of this run.

RELEASE DECISION

Approve for controlled deployment after environment setup. Local migration rehearsal, production builds, API-level workflow gate, and browser verification passed. Do not describe the system as live until Railway services, database backup, environment variables, health checks, and the post-deploy smoke are complete.

What was completed

Product Master

Existing SKUs are selectable and editable. SKU is read-only, changes are audited, stale saves are rejected, image galleries are validated and reorderable, and archive preserves history.

Quote pricing

Quote Studio and quote detail expose list rate, negotiated rate, discount, and GST. The server persists the same commercial snapshot for quote, order, payment, PDF, and downstream records.

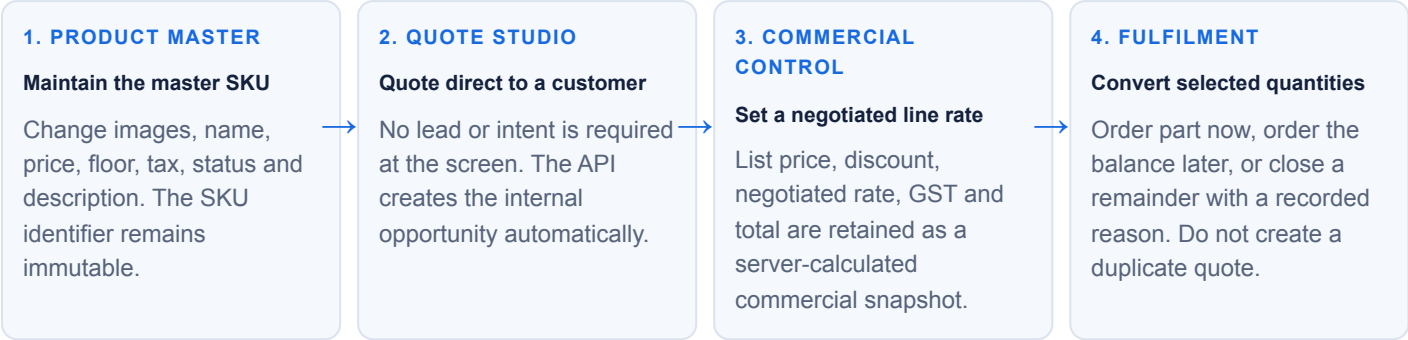

Partial orders

Staff selects only remaining quantity. Each order has a retry key, payment terms, delivery promise, order lines, reservations, procurement demand, documents, and dispatch job.

Session and upload safety

Browser sessions use an HTTP-only cookie. Login throttling, disabled production playground, bounded request sizes, validated image uploads, and least-privilege upload scopes are in place.

Client workflow now delivered

Release gate evidence

GATE	RESULT	EVIDENCE
Migration rehearsal	Passed	All 12 Prisma migrations, including the new client workflow migration, applied to an empty local PostgreSQL database.
API production build	Passed	Nest production compile passed after Prisma client generation.
Web production build	Passed	Next.js 15.5.19 generated all 42 application routes, including Product Master and quote detail.
Client workflow E2E	Passed	Created and edited a product; created a direct quote; checked negotiated GST pricing; created two partial orders; retried one idempotently; rejected over-order; verified order-scoped reservation, dispatch, payment and procurement records; closed a remainder.
Browser workflow	Passed	Cookie-backed login reached the dashboard. Product Master showed locked SKU edit mode. A completed quote showed rate controls, GST totals, two sales orders, and no remaining quantity available to order.

Data and migration design

The old one-order-per-quote constraints were removed only after new order ownership fields were added and legacy records were backfilled. New orders use a serializable transaction and optimistic remaining-quantity update. This prevents two staff members from allocating the same quote balance and prevents a client retry from creating a duplicate order.

BUSINESS RECORD	NEW OWNERSHIP RULE	WHY IT MATTERS
Sales order and dispatch job	Many sales orders may reference one quote; one dispatch job belongs to one sales order.	Partial orders cannot overwrite each other's operational state.
Reservations and sales-order lines	Reservations retain sales order and sales-order-line ownership.	Stock consumption, backorders, and dispatch consume the correct selected quantity.
Payments, documents and demand	Each partial order gets independent payment, PDF, and procurement records.	Commercial, warehouse, and accounts evidence stays traceable.
Quote remainder	Each line reports quoted, ordered, cancelled, closed, and remaining quantity.	The original negotiated quote remains the customer record without forcing duplicate quotes.

Deployment prerequisites

Not deployed in this implementation run. Railway deployment was explicitly deferred. Before touching the client environment, take a database backup, apply the migration to a staging copy, validate the legacy foreign-key backfill, set the listed environment variables, and run the same release gate against the deployed API.

1. Set **CORS_ORIGIN** to the published web URL, **PUBLIC_CATALOGUE_IMAGE_BASE_URL** to the public API origin, and a persistent **CATALOGUE_IMAGE_STORAGE_DIR** or object-storage implementation.
2. Deploy API and web from the committed revision. The Docker images now use lockfile-clean installation and provide **/readyz** and **/api/health** checks.
3. Run database backup, migration deploy, and post-migration orphan/backfill validation before allowing traffic.
4. Execute the client workflow smoke with a disposable account and test customer. Confirm login, quote, two partial orders, and a read-only order/dispatch check.
5. Only then invite the client to acceptance testing. Do not run the destructive reset scripts against the client database.

Residual release risk

Dependency follow-up The targeted Nodemailer upgrade to 9.0.3 is included. The latest npm production audit still reports three high and several moderate advisories in legacy Nest GraphQL/WebSocket and Next bundled dependency paths. npm's automated remedy recommends invalid major downgrades, so it was not applied. The production API exposes only POST GraphQL, disables Playground in production, restricts origins, and does not enable subscriptions; however, a planned framework dependency upgrade remains required for a clean audit.

Asset durability The code validates images and supports a configured persistent directory. Railway ephemeral storage is not suitable for durable product images unless the image directory is mounted persistently or replaced with object storage before the production rollout.

Earlier local user snapshot

The prior read-only audit of the configured local Marble Park database found 98 users: 37 active and 61 inactive. All 751 stored sessions were expired at that audit time. This is a local snapshot, not a current production count; production data remains unverified until Railway is restored and accessed under the deployment runbook.

Evidence sources

Repository source and Prisma schema; migration 20260711090000_client_workflow_completion; compiled API and web; isolated local PostgreSQL release-gate database; browser verification on local web/API services; prior July 10 read-only database and Railway audit.

Generated July 11, 2026. This document intentionally does not claim Railway deployment or a live production recovery.
